

Chapter 13

Video Submission Instructions

Application Deployment & Mobile Wrapping

Overview

This video submission is your proof of completion for Chapter 13. You are required to record a screen capture video demonstrating that you have successfully deployed your full-stack application to a production environment and wrapped it as a mobile application using Capacitor.

Submission Requirements

Format	MP4 or any common video format
Minimum Duration	5 minutes
Audio	Narration or on-screen text labels are encouraged
Upload	Submit via the eLearning portal under Chapter 13 – Assignment Submission

Required Video Contents

Your video must clearly demonstrate all of the following sections:

1. MySQL Database (Production)

- Show the production database server is running (e.g., via phpMyAdmin, MySQL Workbench, or terminal)
- Show the database and tables have been created successfully
- Show sample record exists in the database

2. Slim API Deployment(Backend)

- Show the Slim PHP API has been deployed to the production server
- Open the browser or Postman and demonstrate at least two (2) API endpoints working correctly:
 - A GET request that retrieves data from the MySQL database
 - A POST or PUT request that writes data to the database
- Show the correct JSON response is returned

3. Vue Frontend Deployment (Frontend)

- Show the Vue application has been built for production (npm run build)
- Show the dist folder has been deployed to the server or hosting platform
- Open the live URL in a browser and demonstrate the application is running correctly
- Show that the Vue frontend is successfully communicating with the Slim API (e.g., data loads from the database and is displayed on screen)

4. Mobile Application Wrapping using Capacitor

- Show that Capacitor has been added to your Vue project
- Show the capacitor.config.ts or capacitor.config.json file with correct configuration (app name, app ID, web directory pointing to dist)
- Run the app on either an Android emulator (via Android Studio) or a physical Android/iOS device
- Show the app launching and functioning correctly on the mobile platform
- Demonstrate at least one feature that connects to your backend API from within the mobile app

Checklist Before Submitting

Before uploading your video, confirm all of the following are visible:

- ☐ MySQL database is live and contains data
- ☐ Slim API is accessible via a public URL
- ☐ API endpoints return correct responses (tested in browser or Postman)
- ☐ Vue frontend is deployed and accessible via a public URL
- ☐ Vue app fetches and displays data from the Slim API
- ☐ Capacitor is configured in the Vue project
- ☐ Mobile app runs successfully on emulator or physical device
- ☐ Mobile app connects to the backend API

Grading Note

Submissions that do not show all four sections above may receive a deduction in marks. Make sure your video is clear, stable, and covers each component in order.
